Applicant(s)

WARNER ET AL.

Examiner

Grigory Gurshman

Art Unit

2132

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 09 September 2005.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-17 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-17 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Response to Arguments

1. Applicant has filed no amendments to the claims 1-17.
2. With respect to the instant claims Applicant argues that Sandifer combined with Hoffman does not obviate the Applicant's invention because Hoffman uses an electronic document on a public-access network while Sandifer discloses aircraft-related digital documents. Thus, Applicant alleges that Hoffman and Sandifer is nonanalogous art. With regard to these allegations examiner points out that it has been held that a prior art reference must either be in the field of applicant's endeavor or, if not, then be reasonably pertinent to the particular problem with which the applicant was concerned, in order to be relied upon as a basis for rejection of the claimed invention. See *In re Oetiker*, 977 F.2d 1443, 24 USPQ2d 1443 (Fed. Cir. 1992). In this case, Sandifer teaches a computer based apparatus and method which provide access to complex technical information employed to maintain and repair complicated equipment, such as aircraft, to enable compliance with regulatory requirements (see background part 2). The information is stored in the digital form. Hoffman discloses a system for authorization of electronic transmissions (see abstract) also using electronic documents. Hoffman teaches that the document is processed by a message digest encoding algorithm that generates a message digest code.
3. With respect to the argument that Hoffman is not relevant to the Sandifer disclosure, examiner maintains that one of ordinary skill in the art would have been

motivated to generate a digital document, which records aircraft maintenance information, and generate a MAC for each of the digital documents as taught in Hoffman for verification of the authenticity of the document. This statement clearly demonstrates that the combination would work and presents reasonable expectation of success.

4. Applicant further argues that neither reference discloses encryption such as the one claimed. Examiner respectfully disagrees and points out that Hoffman teaches digitally signing (i.e. encrypting) the digital document with the key.

5. Rejection of claim 1-17 are maintained in view of the reason provided herein.

Claim Rejections - 35 USC § 103

6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

7. Claims 1-13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sandifer (U.S. Patent No. 6,292,806 B1) in view of Hoffman (U.S. Patent No. 5,613,012).

8. Referring to the independent claims 1 and 12, Sandifer discloses a computer aided maintenance and repair information system for equipment subject to regulatory compliance (see title and Fig 1.A). Sandifer teaches a computer based apparatus and method which provide access to complex technical information employed to maintain

and repair complicated equipment, such as aircraft, to enable compliance with regulatory requirements (see background part 2). Sandifer also teaches a CD-ROM-based computer system, which runs an aircraft maintenance and repair assistance program that includes a number of novel features for accessing and managing aircraft maintenance and repair information. The use of CD-ROM technology enables the system to be economically feasible for both information providers, such as manufacturers and governmental agencies, and general aviation maintenance and repair operations to transfer to electronic delivery of maintenance and repair publications (see summary and Figs. 1 and 26).

9. Referring to the independent claims 1 and 12, the limitations "generating a digital document which records events occurring in maintenance of an aircraft" and "multiple digital documents generated by parties involved in maintenance of aircraft" are met by user interface (Fig. 26), which allows users to record the information pertaining to the aircraft maintenance procedures thereby generating an electronic records or documents shown in Fig.1B. Referring to claim 12, the limitation "a repository containing within the searchable database data items extracted form the digital documents" is met by ATP maintenance Information system depicted in Fig. 16 having search capabilities as shown in Fig. 11.

10. Sandifer, however, does not explicitly teach generating a Message Authentication Code (MAC) for each digital document. Referring to the instant claims, Hoffman discloses a system for authorization of electronic transmissions (see abstract). Hoffman teaches that the document is processed by a message digest encoding

algorithm that generates a message digest code. One such algorithm is the MD5 algorithm by RSA, which is well known in the industry. By their nature, message digest algorithms are specifically designed so that it is almost impossible to come up with another document that generates the same message digest code (see column 33, lines 9 -11). According to Hoffman, to verify a signature, a message digest for the document are first calculated (using RSA's MD5 for instance) and sent along with the document's signature tags. The ESD looks up the signature tags and validates the just recently calculated message digest against the message digest stored in the database (see Fig. 22).

11. Therefore, at the time the invention was made, it would have been obvious to one of ordinary skill in the art to generate a digital document which records aircraft maintenance information of Sandifer and generate a message digest (i.e. MAC) for each of the digital documents as taught in Hoffman. One of ordinary skill in the art would have been motivated to generate a digital document which records aircraft maintenance information and generate a MAC for each of the digital documents as taught in Hoffman for verification of the authenticity of the document.

12. Referring to claims 2 and 3, the limitations "encrypting the MAC into cipher text" and "storing the cipher text and the digital document" are met by Fig.2 of Hoffman.

13. Referring to claim 5, Hoffman teaches recovering the MAC from the cipher text and ascertaining validity of the digital document using the MAC (see Fig.2).

14. Referring to claim 6, the limitation "generating a digital document containing the information; applying an algorithm to the digital document, and producing an output;

and encrypting the output into cipher text using an encryption key" is met by teaching of Hoffman that document to be signed is processed by a message digest encoding algorithm that generates a message digest code. The message digest is encoded in order to produce a digital signature. Hoffman teaches encryption of the MAC (see Fig. 2).

15. Referring to claim 7, Hoffman teaches that no paper document is signed.

16. Referring to claim 8 and 9, Hoffman teaches the limitation "transmitting the cipher text and the digital document over a public-access network to storage location" and the limitation "applying the algorithm to the digital document to produce a second output and comparing the recovered output with the second output" by depicting it in Fig. 2.

17. Referring to claim 10, Hoffman teaches that information is stored in searchable databases (see Fig.2).

18. Claims 14-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sandifer (U.S. Patent No. 6,292,806 B1) in view of Hoffman (U.S. Patent No. 5,613,012) and further in view of Carlson (U.S. Patent No. 4,004,382).

19. Referring to the instant claims, Sandifer and Hoffman teach the means for generating maintenance records of the aircraft in digital format and a system for generating a MAC based on the records. Sandifer and Hoffman, however do not teach

Art Unit: 2132

aircraft being inside the building. Referring to the instant claims, Carlson discloses a hangar facility for storage and maintenance of the aircraft (see abstract and Fig. 1).

20. Therefore at the time the invention was made, it would have been obvious to one of ordinary skill in the art to create the means for generating maintenance records of the aircraft in digital format and a system for generating a MAC based on the records of Sandifer and Hoffman while having the aircraft in maintenance hangar as taught in Carlson. One of ordinary skill in the art would have been motivated to create the means for generating maintenance records of the aircraft in digital format and a system for generating a MAC based on the records while having the aircraft stationed in the maintenance hangar as taught in Carlson for performing the maintenance task away from the elements.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Grigory Gurshman whose telephone number is (571)272-3803. The examiner can normally be reached on 9 AM-5:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Gilberto Barron can be reached on (571)272-3799. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Art Unit: 2132

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
